ANGULAR ASSIGNMENT

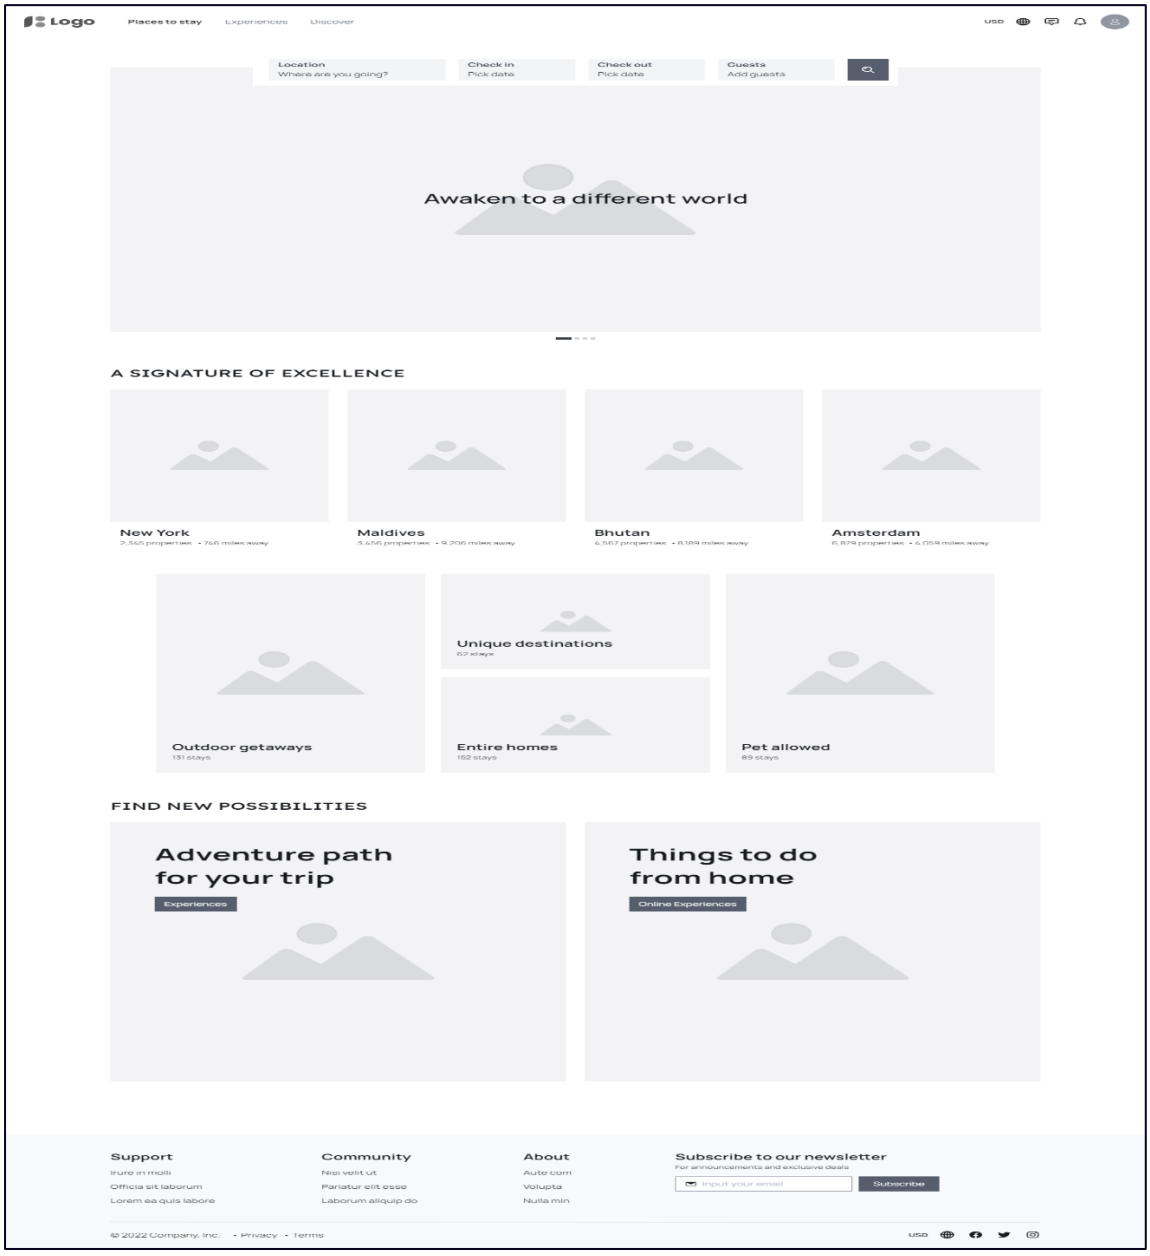

TRAVEL BOOKING

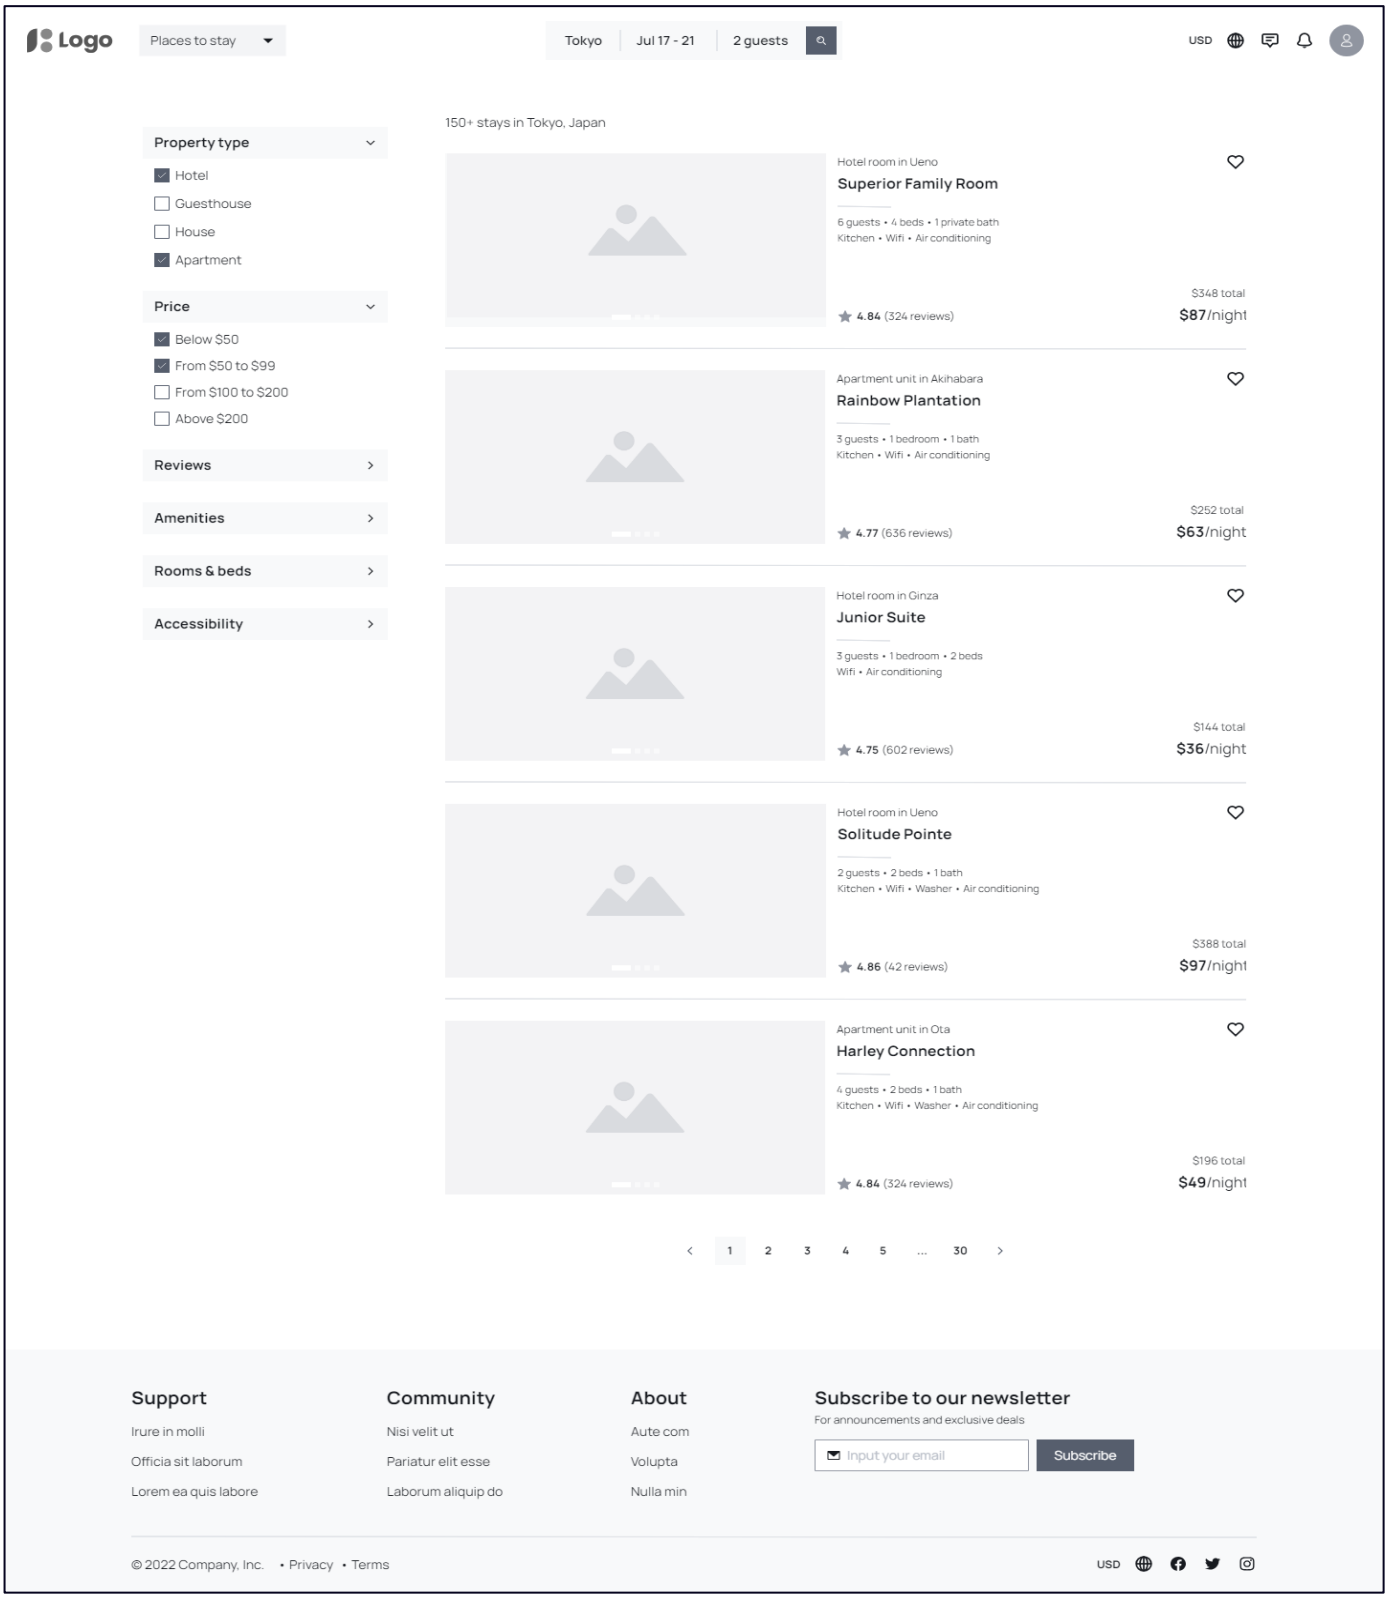

Develop a comprehensive travel booking application that allows users to browse and book rooms at various destinations. The application will include social authentication, room search, detailed room information, and a streamlined reservation and payment process. There will be two user roles: admin and normal users. Admin users will manage destination and hotel details, while normal users will browse and book rooms.

Key Features

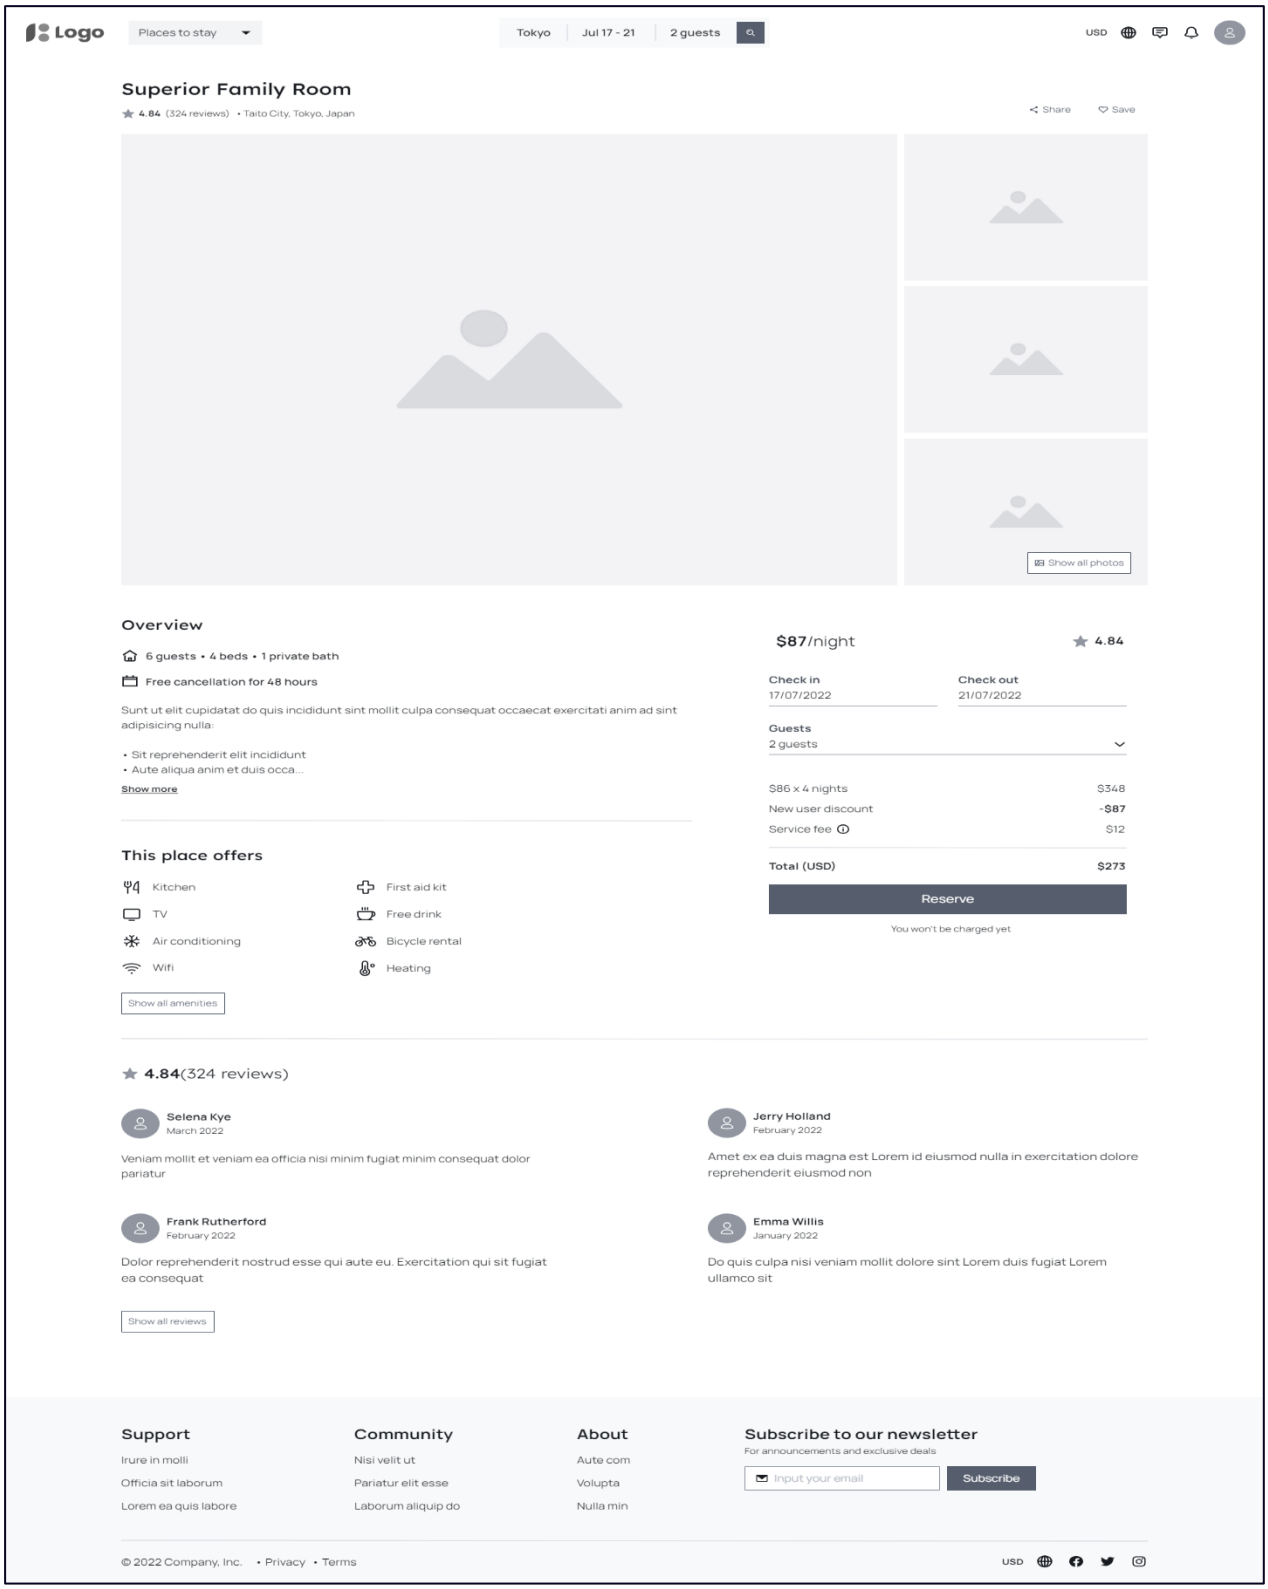

1. **Social Authentication**
   - Implement social authentication using Auth0 or firebase free service.
   - Allow users to sign in using their social media accounts (e.g., Google, Facebook).
2. **Home Page: Destination Listing**
   - Display a list of available destinations.
   - Allow users to browse and select destinations for further details.

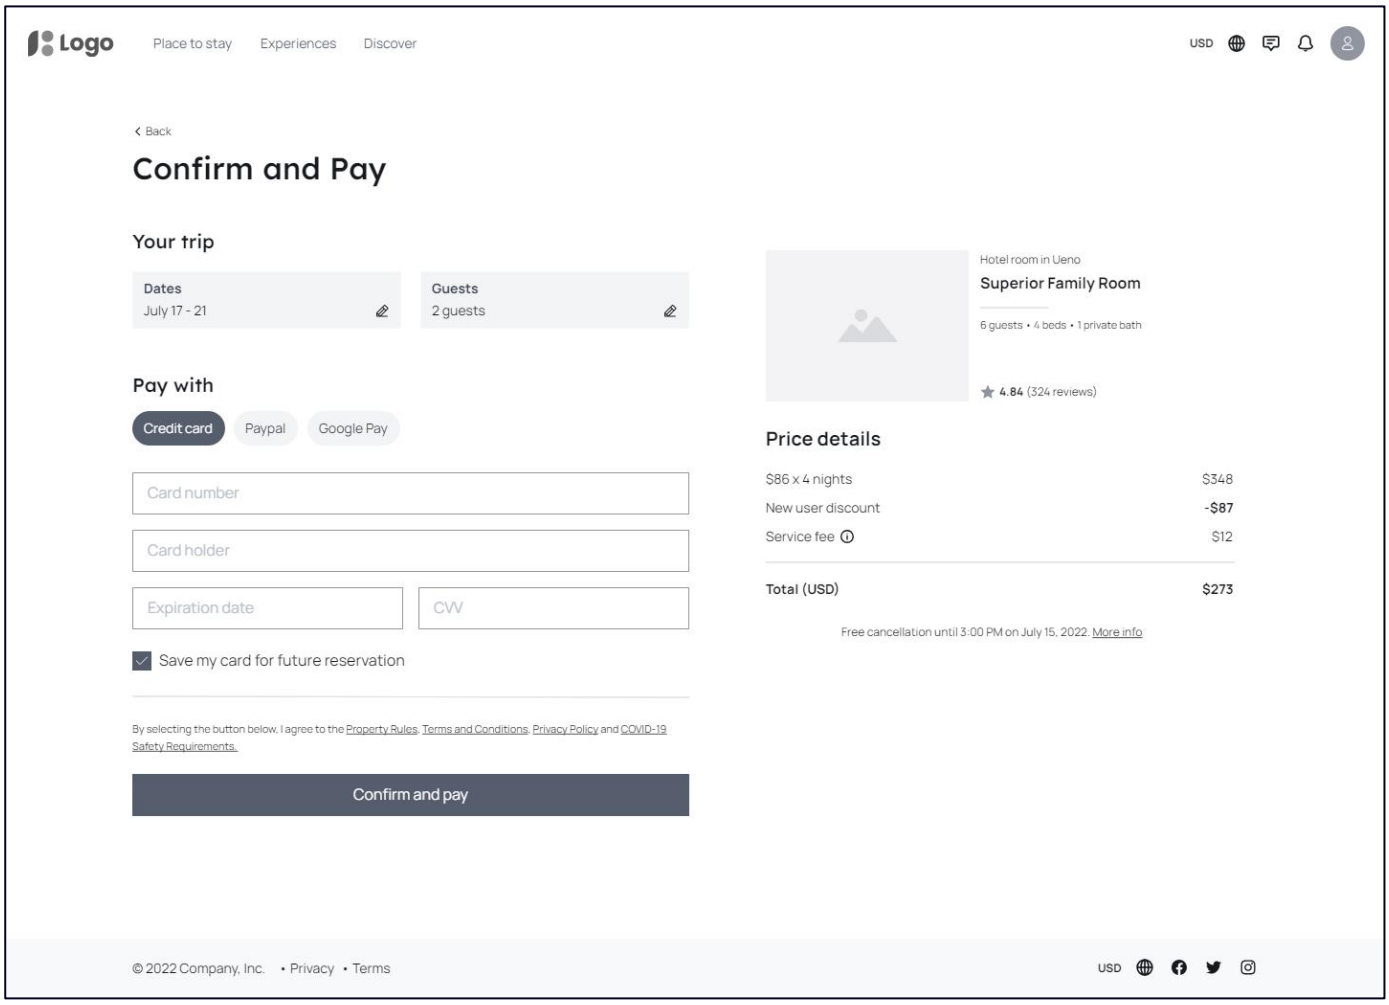

3. **Room Listing Search Results**
    - Provide a search functionality for users to find rooms based on selected destination and other criteria (e.g., date, number of guests).
    - Display a list of available rooms matching the search criteria.

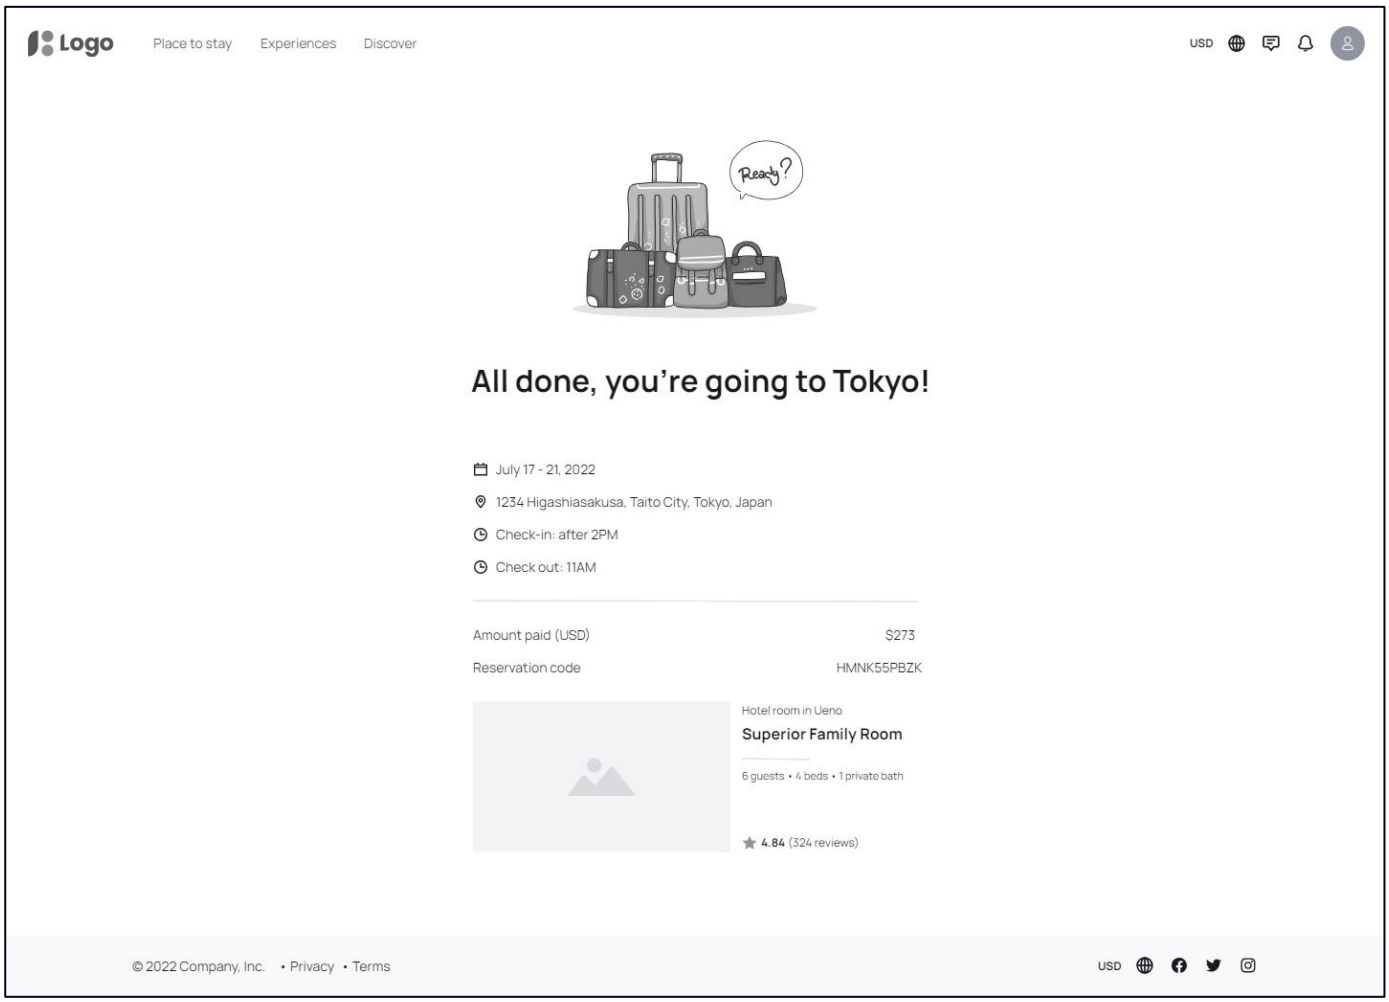

4. **Room Details**
    - Show detailed information about selected rooms, including amenities, photos, price, and availability.
    - Allow users to select and proceed to booking.

5. **Reservation Checkout**
   - Implement a checkout process where users can review their booking details.
   - Include a dummy payment gateway to simulate payment processing.

6. **Checkout Payment Success**
   - Display a confirmation page upon successful payment.
   - Show booking details and confirmation number.

User Roles

1. **Admin Users**
   - Add, update, and delete destinations.
   - Add, update, and delete hotel details for each destination.
   - Manage the visibility of destinations and hotels on the home screen.
2. **Normal Users**
   - Browse available destinations and rooms.
   - View detailed information about rooms.
   - Make reservations and complete the payment process.

Bonus Question: Save Search for Future Reference

- Provide users with the ability to save their search criteria.
- Allow users to easily retrieve and re-run saved searches.

Deliverables

- A fully functional web application meeting the specified requirements.
- Write unit test cases for at least 1 main component, service.
- GitHub link where code is kept (without node modules)
- Add a web worker for any task
- Use any CSS pre-processor
- Link for deployed application. (Note: Deploy the frontend application on any free hosting providers)
- README file where the above two links are kept along with user credentials
- If attempted the bonus points, do mention it in readme.

Evaluation Criteria

- Application Deployed
- Application Architecture
- State management
- Performane Optimization stretgies use cases
- Ease of using application
- Code Quality and best practises
- Bonus points for attempting good to have features

Note

- Please update your angular cli to the **latest version** release.
- Wireframes are just for reference, please use creative thinking to enhance the UI interface and functionality of the platform. This includes Intuitive and Responsive Design.
